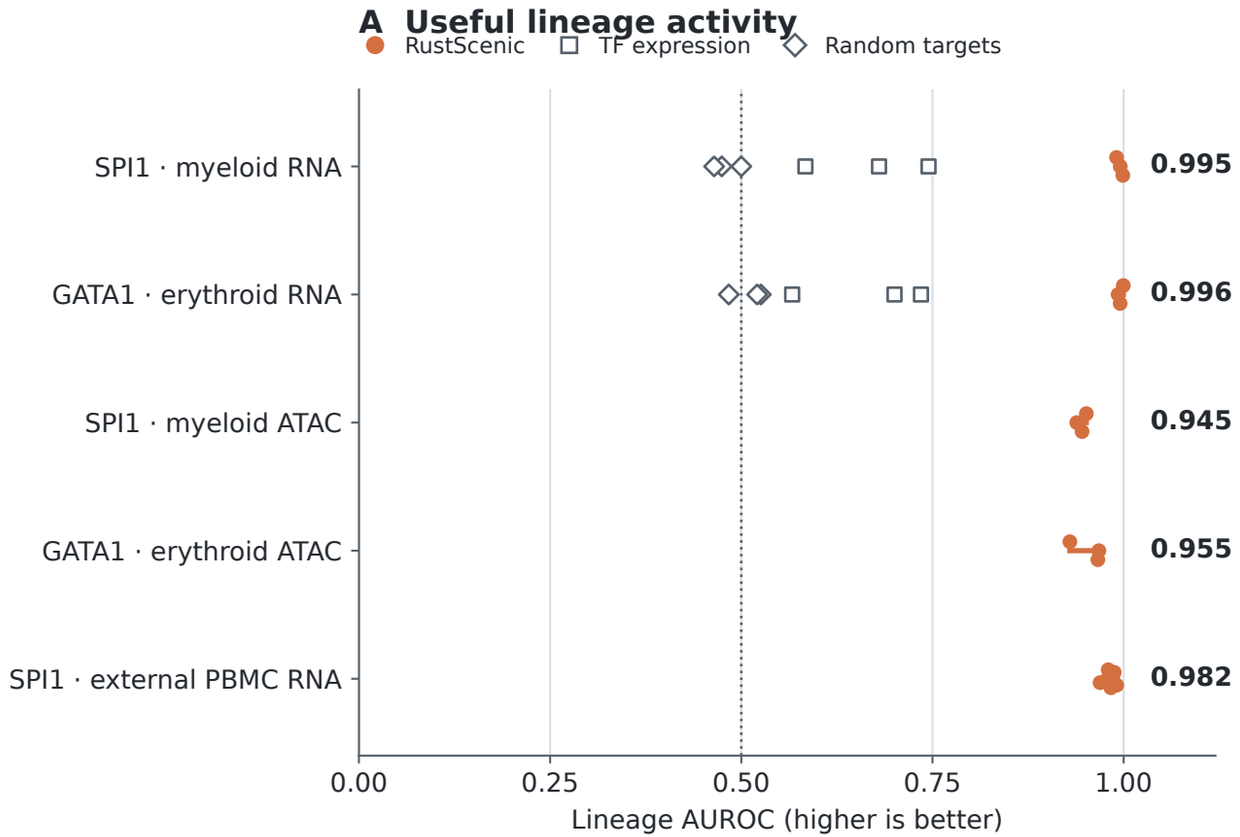
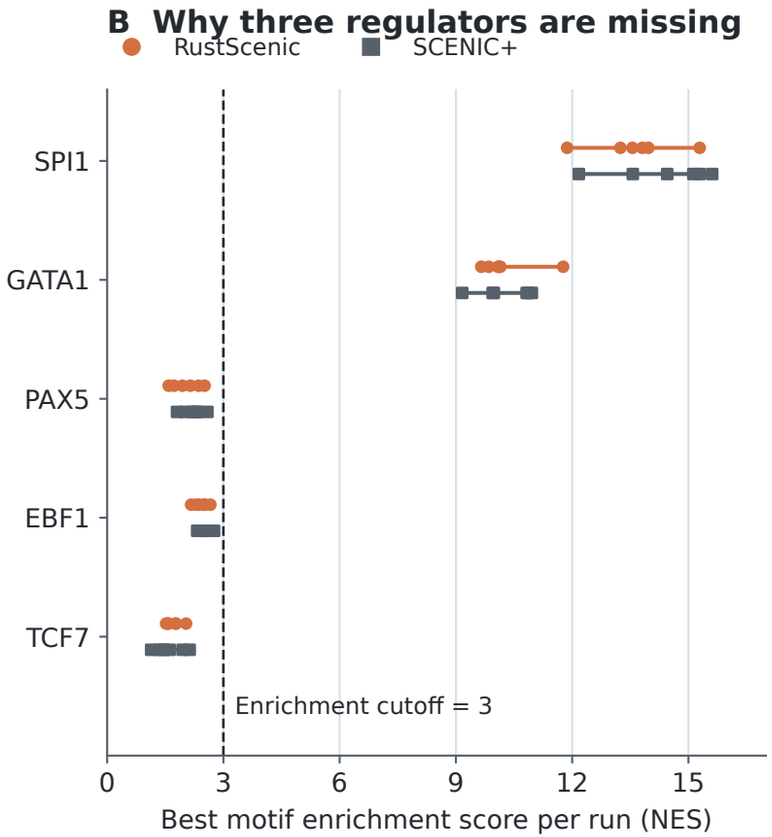
Biological case study: blood-cell regulatory programmes

Saved networks and scores · no model refitting · all five predefined regulator checks shown





A: 20,000-cell training networks; dots = donor means over three seeds (3 BMMC donors; 8 external donors).

RNA and observed ATAC scores recover myeloid/erythroid programmes. Self-gene removal preserves the RNA signal.

B: both training sizes and all seeds. Missing regulators have motifs and initial edges, but fail the unchanged enrichment cutoff.

Post hoc case study. AUROC measures lineage discrimination, not the fraction of correct regulatory edges. Full comparisons accompany this figure.
